Amendments to the Claims:

This listing of claims will replace all prior versions and listings of claims in the application.

Listing of Claims:

(currently amended) A method for forming a cast article, the method comprising:
 providing a photosensitive film, the film comprising at least one layer containing a
 photosensitive material;

selectively exposing at least a portion of the photosensitive material of the film;
removing a portion of the layer containing the photosensitive material, the removed
portion corresponding to either the exposed or unexposed portion of the photosensitive material,
to form a relief surface in the film said relief surface configured for receiving a casting material
without further etching; and

applying a casting material to the relief surface to form a cast article;

wherein the photosensitive layer comprises less than 75% by weight of a water soluble, photosensitive vinyl polymer having pendent hydroxyl groups and being capable of photogenerated insolubility and less than 75 weight percent of a polymeric film-forming binder.

- 2. (original) The method of claim 1, wherein the photosensitive material is developable with aqueous media.
- 3. (original) The method of claim 1, wherein the photosensitive material comprises a photopolymer.

- 4. (original) The method of claim 1, wherein the photosensitive material comprises a photoinitiator and a monomer, an oligomer, or a combination of monomer and oligomer.
- 5. (original) The method of claim 4, wherein the photosensitive material comprises an ethylenically unsaturated material.
- 6. (original) The method of claim 4, wherein the photosensitive material comprises an acrylate material.
- 7. (original) The method of claim 1, wherein the photosensitive material comprises a water-soluble, photosensitive vinyl polymer.
- 8. (original) The method of claim 7, wherein the water soluble, photosensitive vinyl polymer comprises a polyvinyl alcohol polymer.
- 9. (canceled)
- 10. (original) The method of clam 3, wherein the photopolymer has pendant, photocrosslinkable, styryl groups.
- 11. (original) The method of claim 1, wherein the photosensitive material comprises less than 50 weight percent of a photopolymer, about 30 to 90 weight percent of a binder resin, and about 0 to 40 weight percent of a compatible plasticizers.

- 12. (original) The method of claim 11, wherein the photosensitive material comprises about 15 to 50 weight percent of a photopolymer having pendant, photo-crosslinkable, styryl groups, about 50 to 80 weight percent of a binder resin, and about 0 to 15 weight percent of a compatible plasticizer;
- 13. (original) The method of claim 1, wherein the first layer further comprises a plasticizer.
- 14. (original) The method of claim 1, wherein the laminate further comprises a support layer.
- 15. (original) The method of claim 1 wherein the first layer of the laminate is from 1 to 100 mils thick.
- 16. (original) The method of claim 1, wherein the photosensitive laminate film is flexible.
- 17. (original) The method of claim 1, wherein the casting material is selected from the group consisting of plaster, polymeric resins, uv-curable materials, and low-melting point metals.
- 18. (original) The method of claim 1, wherein the casting material is used to form a flexographic printing plate.
- 19. (withdrawn) A cast article formed using the method of claim 1.

20. (withdrawn) The cast article of claim 19, wherein the article is a flexographic plate.
